

INHUMAN MINDS

ARTIFICIAL NEURAL NETWORKS

- Inspired by neuroscience
- Densely connected, multi-path
- **Flexible but opaque**

TRADITIONAL PROGRAMMING

- Like a flowchart
- Each decision narrows the space
- **Interpretable but brittle**

WHAT IS 'ARTIFICIAL INTELLIGENCE'?

AUTOCOMPLETE ON STEROIDS

PREDICTING THE NEXT WORD — AT PLANETARY SCALE

- Has read essentially every **novel, textbook, blog post** — in every language
- Has seen most publicly-posted **images and video**
- Being able to **simulate a mathematician** eventually means *being* one
- For "verifiable" answers, even a **99% error rate is fine** — just keep the 1% that passed checks

HAS *MEMENTO* LIMITATIONS

LIKE LEONARD — WORKS ONLY WITH THE NOTES IT CARRIES

- **Amnesia past the training cutoff** — new memories require notes in the prompt
- **Not a database** — by default, answers come from memory, not lookup
- **Subject to prompt injection** — can be manipulated through the notes it's handed
